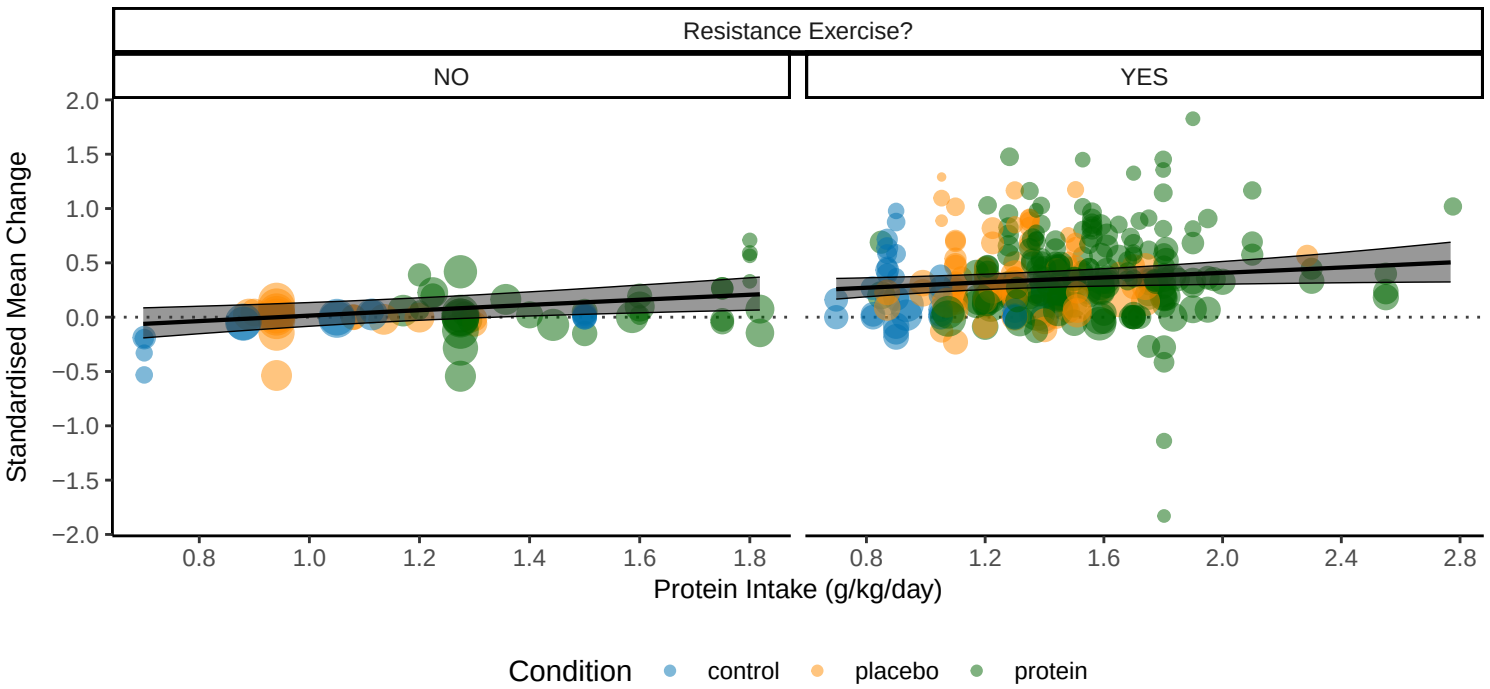
Dose−response effects of protein intake on direct muscle mass/size change

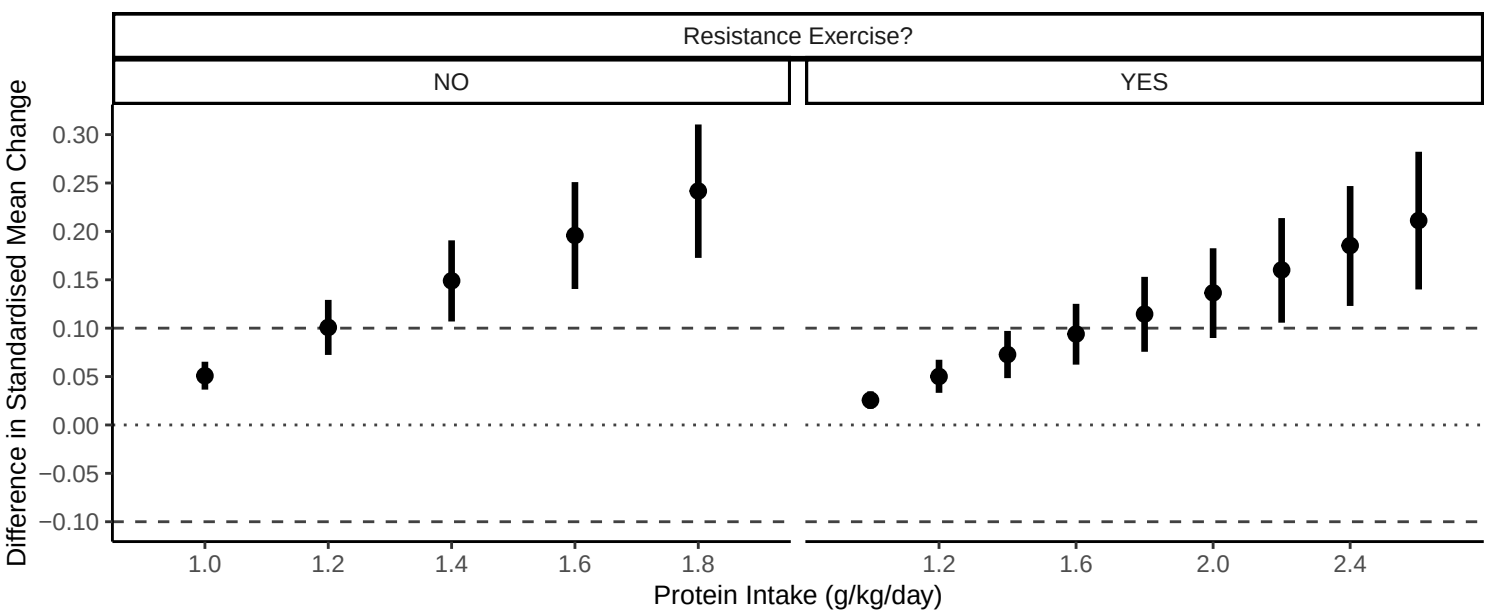
Bayesian model averaging with LOO−CV stacking weights

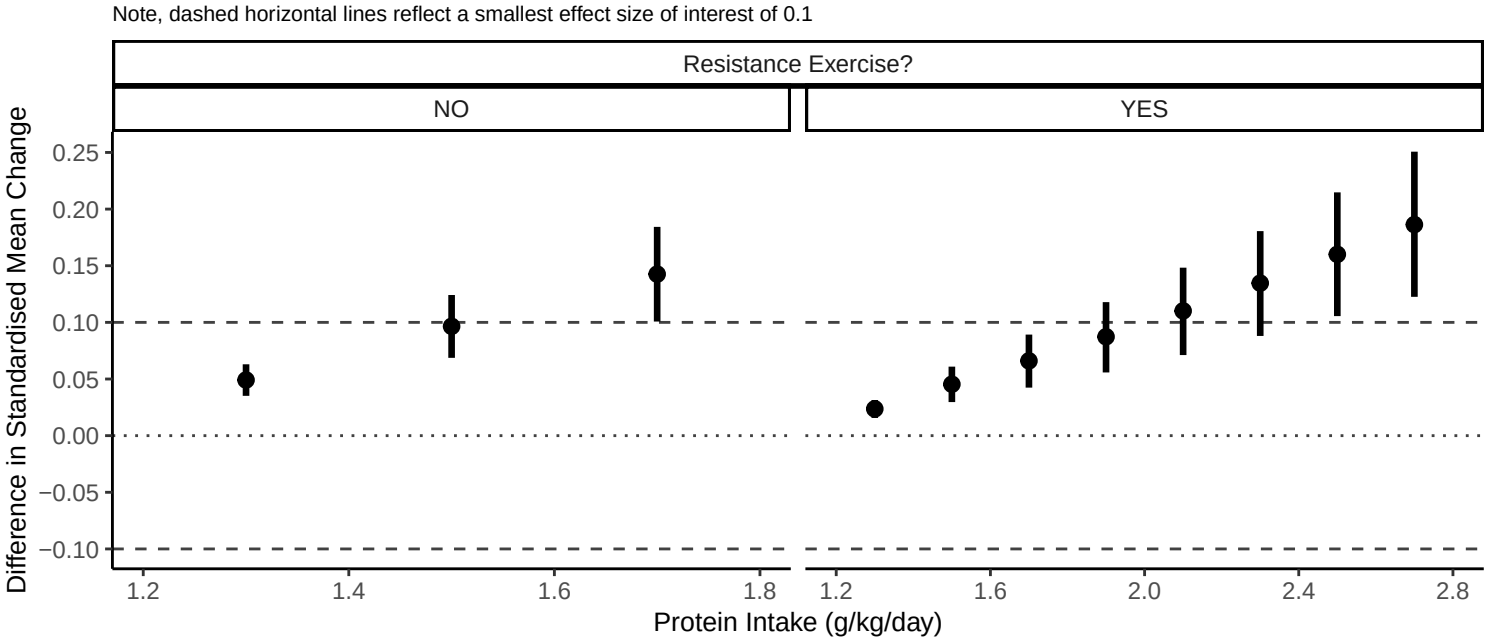
Predicted effects



Contrasts against 0.8 g/kg/day (i.e., RDA intake)

Note, dashed horizontal lines reflect a smallest effect size of interest of 0.1



Contrasts against 1.1 g/kg/day (i.e., median control/placebo intake)


Note, dashed horizontal lines reflect a smallest effect size of interest of 0.1
